

What is IOT ?

IOT stands for Internet of Things. It is a network of different devices that can share and exchange data over the internet.

Some examples of uses of IOT

Household thermostats use sensors and can be easily controlled using phones.

It has a sensor that checks room temperature

Initially it also records the temperature pattern .

Next it is connected over Wi-Fi, allowing it to store data in a cloud server and users can control it using their phones

Fitness bands and smart irrigation are some other examples

Why is ESP popular in IOT ?

ESP chips have wifi module directly built in chips which makes it extremely useful for IOT.

ESP chips board are comparatively cheap so they can be used for hobyst project.

It has deep sleep mode that Reduces power consumption

It has wifi module , enough ram as a result it is more proffered.
